Internship Application Guidelines for AI Students

1. Choosing the right internship

Students should prioritize internship opportunities that match their technical skills and career interests.

Read the job description carefully and list the required skills, the preferred skills and the key technologies before applying.

AI internships usually require Python, machine learning, NLP, computer vision, data analysis, LLMs, RAG, APIs or automation.

Check the application deadline early and prepare the application at least one week before the deadline.

Remote opportunities are suitable when the student has strong communication skills and can work independently.

2. Preparing the CV

A strong CV is limited to one page and highlights the skills that appear in the internship description.

Put the most relevant skills and technical projects at the top of the CV, and tailor the CV for every application.

Describe each project with the problem, the tools used and the measurable result, and never invent experience or skills.

Include links to GitHub repositories and notebooks that demonstrate real work.

3. Writing the cover letter

A customized cover letter should explain why the student is interested in the company and the specific role.

The cover letter should connect two or three matching skills to the responsibilities in the job description.

Keep the cover letter short, professional and free of spelling mistakes, and address it to the hiring team.

4. Showing evidence of technical projects

Applicants should present evidence of technical projects such as RAG assistants, machine learning models or automation workflows.

Each project should have a clear README, a short demo and a description of the evaluation results.

Missing skills should be reviewed before the application, and the student can mention that they are currently learning them.

5. Tracking applications

Students should track the company name, role, location, deadline, match score and application status for every opportunity.

Update the application status after each step, for example to apply, applied, interview or offer.

Follow up politely one week after submitting an application if no response is received.

6. Preparing for interviews

Prepare to explain every project on the CV, including the data, the model, the evaluation and the challenges.

Practice common questions about Python, machine learning fundamentals and teamwork before the interview.

Prepare a few questions to ask the interviewer about the team, the tools and the learning plan of the internship.
